Thomas Maddock's ...

Sanitary Pottery

Its beginning and development

FROM the very earliest times pottery making has been recognized as one of the fine arts. Recently specimens of pottery have been unearthed in Egypt that recognized authorities have accredited to the period of 4000 years B. C., and in the various great museums throughout the world undoubtedly there are other authentic specimens of Chinese pottery dating from the very earliest times.

The beauty of these examples of art, created during the time that civilization was still in the cradle, has survived during all the ages. The early Greek vase, for instance, with its graceful outline and beautiful decorations still remains the despair of its modern imitators. Egypt, it is true, produced wonderful specimens of pottery before the birth of Christ, but it remained for the Greeks to perfect shapes and decorations. But the latter did little if anything to improve the quality of the ware.

It is to the Chinese that we are indebted for that fine quality of porcelain which is the correct name for china. In the annals of that great traveler, Marco Polo, (A. D. 1254-1324) we read of the rare beauty of the specimens that he brought from China to Pope Gregory X. Later, when Europe opened up trade with China and the mariners of that day brought back samples of early Chinese porcelain, European potters for the first time realized the inferiority of their own product. They were forced to concede the superiority of the Chinese potter whose ware is described in the records of those times as being hard, white, translucent and with a glass-like surface.

The first we learn of porcelain or china being made in Europe was when Johann Bottger (A. D. 1682-1719), a German chemist, accidentally discovered a bed of kaolin. England, where they had

been making pottery for centuries, soon learned the art of making china which was brought to such a high state of perfection by that most famous of all modern potters, Josiah Wedgewood (A. D. 1730-1795). And it is in England where we first find the potter entering the field of the sanitary engineer. The firms of Dolton's and Twyford's, both of which are still in business after several generations, were the first to make sanitary appliances.

As the demand for these very necessary appliances increased throughout England, there was created naturally a market for these fixtures in this country. This market was supplied by the English manufacturers who exported their product to the United States and enjoyed a very good trade for many years.

It was only a short time until American manufacturers were able to improve upon the quality of the English sanitary porcelain ware. Then American inventive genius gradually made improvements in the mechanical operation of the fixtures, until today the sanitary appliances of American manufacturers are recognized as the standard of the world in quality, design and operation.

In the creation and development of the sanitary pottery industry in this country, the firm of Thomas Maddock's Sons Company has played a most important part. Pottery ware of various kinds had been made in the United States for many years, but it was not until 1873 that the American potter attempted to make sanitary ware. Thomas Maddock, founder of Thomas Maddock's Sons Company, was the first to do so and he had the foresight to realize the possibilities of this branch of the pottery industry.

While the early requirements of the trade were only for round basins, French closet bowls and short round hoppers, nevertheless the mechanical difficulties encountered in the production of even such simple pieces would have discouraged any manufacturer who lacked the vision and determination of Thomas Maddock. Then again, in the beginning, great difficulty was experienced in inducing American dealers to accept the domestic ware. The demand was all for the imported product. But this condition lasted for only a comparatively short time because the quality of the home product soon rivaled and then surpassed the foreign wares.

Thomas Maddock's Sons Company was the first to manufacture sanitary ware of a vitreous china body, which was so marked an improvement over the soft porous body originally used.

Through constant development the water closet, which was first made in this country by Thomas Maddock, has resulted in the non-soiling, silent acting, syphon jet of today.

The first vitreous china lavatory was made by Thomas Maddock's Sons Company about 1895. However, it was not until some years later that lavatories were recognized as an important factor in the pottery industry.

The low pattern vitreous china tank, which has practically eliminated the wooden tank, was first produced by this company.

Few people appreciate the importance of these various sanitary plumbing fixtures and the very necessary part they play in our every-day life. Without them it would be impossible for people to live in crowded communities. In large cities disease would run rampant and the plagues of the middle ages would, in all likelihood, be repeated.

The modern bathroom has contributed more than any other one thing to make this a healthful nation and the potter has had a most important responsibility in this development.

It has been said that no nation can progress without sanitary appliances, and that sanitation and civilization go hand in hand. In any event, the lowest type of humanity is to be found where the smallest number of plumbing fixtures are used, and conversely, the highest type of civilization is to be found where the greatest number are in use.

Vitreous China LAVATORIES

Always sanitary and easy to clean

The Vitreous China Lavatory

A FULL appreciation of the advantages offered by Madbury Vitreous China Lavatories may best be gained by considering the progress of lavatory construction generally during the last half century.

The type of lavatory that was in the most general use during the latter part of the nineteenth century was the marble slab and earthenware bowl. A serious objection to this lavatory was that the joint between the slab and bowl was a dirt catcher and a breeding place for disease germs. While this was the most serious objection, it was by no means the only one. It was found that the marble slab stained easily, that it soon lost its lustre and that it was extremely hard to keep clean.

As far back as 1883 Thomas Maddock's Sons Company issued a catalog showing the construction of the bowl and slab in one piece, but, as the use of vitreous china for bathroom fixtures was then unknown, this lavatory was made of common earthenware.

The common earthenware lavatory is most unsatisfactory. Because its body is soft and porous, the glazed surface is subject to crazing and cracking. Furthermore, it is so light and fragile that it is easily broken in handling and in ordinary use. The foreign sanitary manufacturers still use the common earthenware body and have made practically no attempt to produce vitreous china.

Lavatories made of fire clay have been used for a number of years but the sale of this type has diminished, until today it is not a factor in the market. These lavatories are made of a coarse grained body similar to a fire brick and are covered with an enamel. The body is open and porous so that it will absorb moisture and because of the difference in the character of the body and glaze, the surface is subject to crazing.

Cast iron enameled lavatories came into general use as the defects in the two-piece marble slab lavatories became so apparent. Because of the lower price at which the enameled iron fixture is sold it

has been used in large volume. However, it is fast being displaced by the vitreous china lavatory because of the merits of a vitreous china body over cast iron. The vitreous china lavatory is more popular because it can easily be kept clean and will not lose its glossy surface in use. It is not affected by acids and its surface cannot peel off.

The use of vitreous china for bathroom fixtures was developed by Thomas Maddock's Sons Company. Vitreous china is a clay material that is fired to a high degree of heat and becomes extremely hard. After the first firing, the hard vitrified body is covered with a glaze and the piece is again fired. The important thing to remember about vitreous china is that this firing is done at such a high temperature that the piece reaches a molten stage and the hard body and glaze become one homogeneous mass. Vitreous china is guaranteed not to craze, crack or discolor under the most severe usage. Acids cannot injure it. The surface is in reality a part of the body and the body itself is hard, non-porous and impervious to moisture —VITRIFIED, as the name implies.

Blows such as would be received from the falling of cups, tumblers and bottles, sometimes break lavatories made of common earthenware and frequently loosen the enamel on other types so that the surface chips or peels off. This cannot happen to vitreous china lavatories because the body and glaze, being one solid mass, cannot be separated.

The first lavatory ever constructed of vitreous china was made by Thomas Maddock's Sons Company about 1895.

The vitreous china lavatories that are made today by this company represent the highest development yet attained in the production of these sanitary fixtures. They are strong and sturdy and cannot be broken by any blow that they would receive even in unusually hard use. They are absolutely sanitary and easy to keep clean. They have certain built-in refinements that are to be found exclusively in lavatories of Thomas Maddock production.

For example, in the Madbury lavatories shown in this catalog there is no exposed metal work above the slab. All-china handles and escutcheons are used on the supply valves and a china knob and escutcheon on the pop-up waste. Danger of breaking the china

handles in ordinary use has been eliminated by the adoption of the new webbed type Titan handle described on page 227.

The construction of the integral supply feature in the Madbury lavatory is such that the thorough mixing of hot and cold water is assured before the water reaches the nozzle.

The stream of water is directed toward the centre of the bowl in exactly the right place to wash the hands in running water or to fill a drinking glass conveniently.

The bowl is square and unusually large, allowing more washing space than any other lavatory.

Another feature that is exclusive to Madbury lavatories is the Maddock Overflow Cleansing Device. Recognizing the fact that the overflow channel in ordinary lavatories is a lodging place for filth and disease germs, we perfected this innovation. Its simplicity of operation is indicated by the accompanying illustration. In order to thoroughly cleanse the overflow channel it is only necessary to place a finger over the supply nozzle and turn on the supply valves. The water which ordinarily would run through the nozzle is forced back under pressure and down into the overflow in such a manner that the walls of the overflow are thoroughly flushed and cleansed.

The most recent development in lavatory construction is the integral all-china ice water supply attachment—an exclusive Maddock feature. This is shown on pages 12, 26 and 44. The demand for running ice water in rooms of hotels, apartment houses and various institutions is increasing rapidly. This attachment ideally fills this demand and overcomes the many objections to the separate ice water fixture. In it all metal parts are concealed and working parts can be removed from the top without disconnecting the fixture. The nozzle is entirely above the slab so that it is always clean and a drinking glass can readily be filled.

Vitreous china lavatories are made entirely by hand and, therefore, do not have the harsh lines of those made by mechanical processes. Furthermore, in firing a vitreous china piece to the extreme heat that is necessary to make it non-absorbent, stainproof and practically unbreakable it becomes molten and often loses its straight lines. Therefore, vitreous china lavatories have a

certain distinctive irregularity of line—the kind of irregularity that distinguishes the hand-wrought silver creation from one that is manufactured by machinery.

It is naturally expected that the original cost of Madbury lavatories will be higher than the cost of ordinary fixtures. The real fact is that the difference is very little and, when it is remembered that it costs just as much in labor, piping, metal trimmings, etc., to install an inferior lavatory, it will be seen that the difference in the cost of the two types INSTALLED is negligible. Furthermore, the thing to consider is not first cost but final cost, and the ultimate cost of Madbury lavatories will actually be very much lower than that of the ordinary fixture because the Madbury will be giving satisfactory service long after the cheaper lavatory has worn out and has been replaced.

MADBURY K-2000

White Vitreous China Straight Front Integral Supply Nozzle Lavatory and Pedestal

SPECIFICATION:

White Vitreous China Straight Front Lavatory; Size (see below), with Integral Supply Nozzle, Cleansing Overflow Feature, Square Bowl 6½ inches deep, Hooded Overflow, Anti-splash Rim, Plain Square Pedestal and N. P. Brass Wall Brackets. Fitted with Compression Supply Valves with All-china Cross-arm Handles and Escutcheons, Pop-up Waste with All-china Knob and Escutcheon, 1¼- or 1½-inch N. P. Brass "P" Trap to wall with China Escutcheon and ⅜-inch N. P. Brass Supply Pipes to wall with China Handle Stop Valves and China Wall Escutcheons.

DIMENSIONS:

Lavatory, inches	20x24	22x27	24x30
Approximate weight, packed complete, pounds	190	205	230

NOTE: As this Lavatory is made with an Integral Supply Nozzle, it is sold only with the fittings as shown, with or without Trap and Supply Pipes.

Measurements may vary from ¼ to ½ inch

In addition to the many Madbury features this lavatory has an integral china ice water attachment with all metal parts concealed. All working parts can be removed from the top without disconnecting the fixture. The nozzle is entirely above the top of the slab so that it is always clean and a glass can easily be filled. This makes a clean, sanitary attachment and overcomes the many objections to the separate ice water fixture.

MADRID K-2203

White Vitreous China Straight Front Lavatory with 6-inch Integral Back and Leg

This lavatory is especially adapted for public comfort stations. Having an integral supply nozzle it eliminates all metal fittings from the top of the lavatory, thereby making it easy to keep clean. The valves being concealed in the floor, the user does not touch any part of the fixture. Nothing but vitreous china fixtures should be considered for public comfort stations because of the hard usage to which they are subjected.

MADRID K-2209

White Vitreous China Straight Front
Surgical Lavatory and Leg

Vitreous China BIDETS

The fixture that completes the modern bathroom

The importance of the Bidet in the modern bathroom

THE Bidet (pronounced Be-DAY) is an important sanitary fixture which has not been used extensively in this country due to the lack of knowledge of its health protecting features. For years it has been in common use in Europe and all Latin-American countries. Through ignorance of its advantages many regard the bidet as a fixture to be used for birth-control. This is obviously incorrect because a plain water douche cannot accomplish this purpose.

The bidet fixture is an appliance designed to maintain for the user a constant state of cleanliness of the private parts. It is made entirely of white vitreous china, is 14½ inches in width and has a height of 15 inches from the top of the rim to the floor.

It is equipped with hot and cold supply valves and a pop-up waste to retain water in the bowl or to drain it when desired. The inside walls of the bowl are washed by a flushing rim on the same principle as the watercloset, although the bidet is not designed nor intended to carry off human waste matter.

The bidet is also provided with an integral douche or jet, operated when desired by means of a transfer valve which directs a stream or column of water upward from the bottom of the bowl. (See cross-section illustration on page 93.)

This douche is formed by a cluster of small holes so arranged as to direct the water to one central point, thereby forming a solid stream. In the earlier models of bidets the douche was made of brass in the form of a nozzle to which a rubber tube with a syringe appliance might be attached for women's use. The use of the bidet as a syringe was a dangerous practice, however, as uniform temperature of the water could not be assured while the douche was in use. Turning on the cold water in another part of the house was likely to raise the temperature of the douche, and burning or scalding sometimes resulted.

The brass nozzle douche was also objectionable because the user would strike it with the fingers while washing.

After a bowel movement it is impossible to cleanse the anus with dry paper. This practice, the medical fraternity tells us, is respon-

sible for a large proportion of the existing cases of hemorrhoids or piles. The use of the bidet does much to eliminate the possibility of developing hemorrhoids or piles, and is also recommended for their treatment. After each passage, the anus actually should be washed with water. (The bidet is usually installed alongside of the watercloset.)

With women, the bidet should be an indispensable bathroom fixture, because proper attention to health requires bathing of the genital organs more frequently than can be accomplished conveniently with the bath tub. It is essential and conducive to good health to wash these parts twice daily.

This use for the bidet is also essential for men, because the ordinary tub or shower bath is not sufficient to secure a similar degree of cleanliness. As with women, men too should bathe these parts twice each day.

Women will find the bidet a very important and convenient fixture for use during their menstruating period. The genital organs should always be thoroughly cleansed when changing the sanitary pad, and the bidet is the proper fixture for this use. The bidet is particularly desirable in manufacturing plants where a number of women are employed or in department stores, women's colleges and other institutions.

Another important use of the bidet is that of a foot bath. As it is 15 inches high from the floor to the top of the rim, it can be used very comfortably as a foot bath. When the waste plug is closed the bidet will hold about 3 inches of water. There will be no hesitancy about using the bidet as a foot bath after it has been used for bathing other parts because, being made of pure white vitreous china and having a flushing rim, it can be kept spotlessly clean and sanitary by simply rinsing with water or wiping with a damp cloth. It cannot tarnish or discolor.

The private parts may be washed by the bidet with or without the use of the douche. By closing the pop-up waste the bowl may be filled and the washing done with the hand. After this the parts may be rinsed by using the douche. If preferred the entire washing may be done with the douche.

In using the bidet it is not necessary to undress. The clothing is in the same position as when using the watercloset.

The use of the bidet is a clean habit and when once acquired it becomes an important part of the sanitary precautions of our daily life. Its importance in promoting better health can hardly be overestimated.

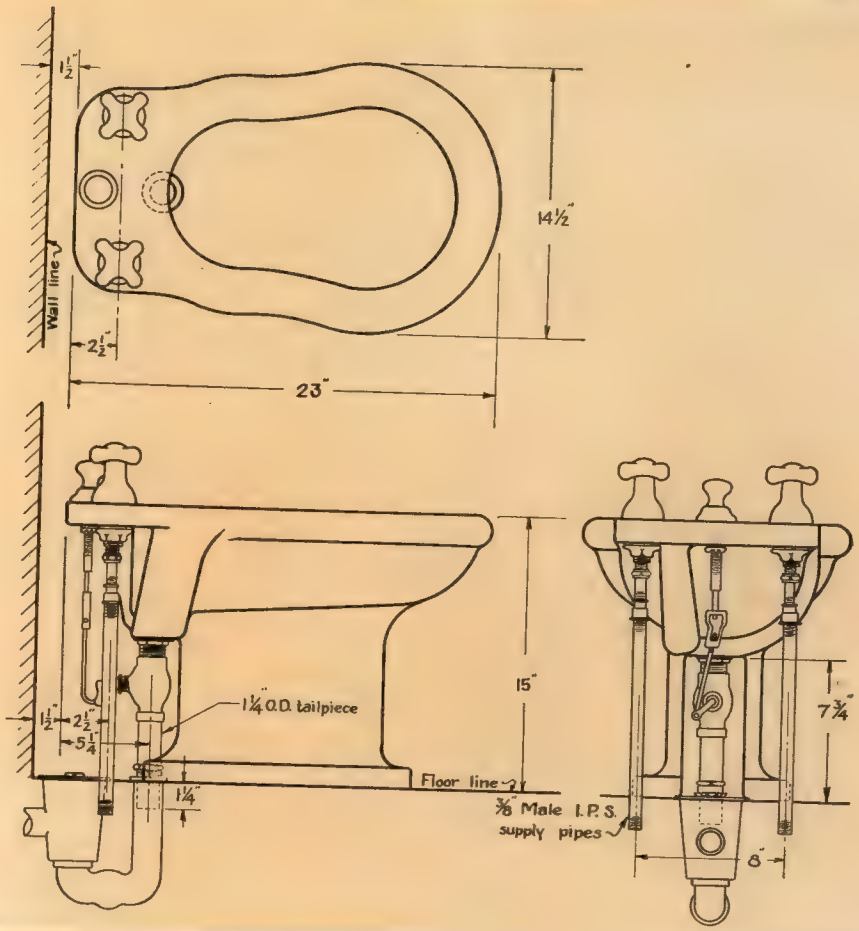
MADELTA K-2828

White Vitreous China Flushing Rim Pedestal Bidet

SPECIFICATION:

White Vitreous China Flushing Rim Pedestal Bidet; Height 15 inches, Opening of Bowl 10x16 inches. Fitted with two Compression Supply Valves with All-china Cross-arm Handles and Escutcheons supplying hot and cold water to Flushing Rim; Pop-up Waste with All-china Knob and Escutcheon and 1¼-inch O. D. Tail Piece and ⅜-inch N. P. Brass Supply Pipes to floor with China Floor Escutcheons.

Approximate weight, packed complete, pounds 85



K-2828 Roughing Measurements

THOMAS MADDOCK

Vitreous China CLOSETS

The utmost in bathroom sanitation

The evolution and development of the Water Closet

THE most important fixture of all sanitary appliances is probably the water closet. The designers of this fixture have attained a very high standard of efficiency considering the difficult function this device has to perform. To make a water closet that will carry off human waste, that will be self-cleansing, sanitary, non-soiling and at the same time noiseless in operation, has been no small task to accomplish.

The first use of water closets dates back to about 1850, when the city of London compelled house owners to connect with the sewer. However, as early as A. D. 100 the Roman Emperor, Nerva Augustus, commissioned the military engineer Frontinus to prepare a report of the conditions of the water supply of Rome with particular reference to sanitation. This report is interesting as it shows a very liberal use of water and tends to confirm the impression that the troughs or depressions afterwards found in the Roman baths were used for the purpose of carrying off fæcal matter.

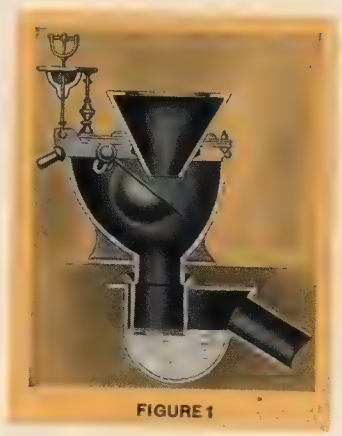

FIGURE 1

The first real water closet was that known as the pan closet (figure 1) which was in general use until about 1865 when it was displaced by the valve closet (figure 2). This latter type was a marked improvement over the pan closet but it was far from being a sanitary fixture.

The succeeding steps seem to have been taken by the potter, and rightfully so because it was soon demonstrated that water closets made of any material other than earthenware would not be strictly sanitary. Consequently the inventor found it necessary to confine his improvements to a point where it was possible for the potter to reproduce his idea in clay.

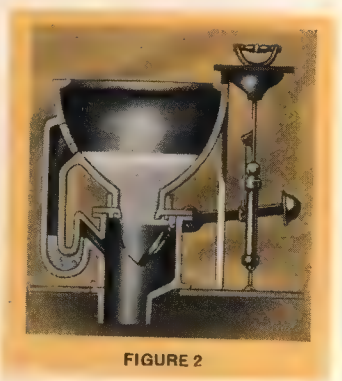

FIGURE 2

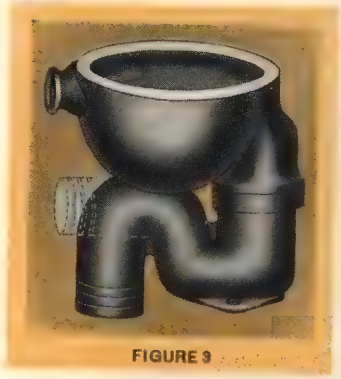

FIGURE 3

The next development was the production of the washout closet about 1875 (figure 3). This was the first type of all-earthenware water closet and was originally made in two pieces, the trap and bowl being fastened together. Later the potter was able to produce the washout in one piece, and this was a marked advance in the art of sanitary pottery. This closet remained in general use until about the year 1900 when the washdown type (figure 4) began to take its place. Today practically every plumbing ordinance prevents the use of washout closets.

As early as the year 1880, Wm. Smith, of California, patented a jet closet (figure 5) the development of which was slow because of the difficulties it presented to the potter. Later by combining the syphonic principle (a feature which the Smith closet did not have) with the jet, the syphon jet principle of operation was perfected about 1895.

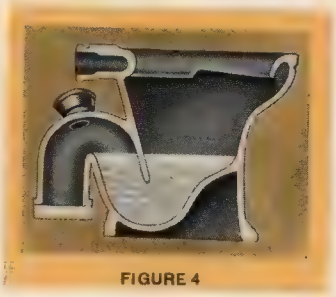

FIGURE 4

The wall-hanging type of closet was first introduced in this country by E. G. Watrous in about 1905.

FIGURE 5

The bowl of this closet was emptied by what is commonly known today as the blow-out principle and, in operation, was quite similar to the Smith closet. While this closet has had some sale for public and semi-public places, there are comparatively few of them now in use. The method of installing them is expensive and the blow-out pattern is noisy in operation.

The washdown and syphon jet are the types now in general use. These types have supplanted all others with the exception of the reversed trap which is a recent development. This latter is a combination of the washdown and syphon jet having the action of the former and an appearance similar to the latter.

During all the time in which new principles of operation were being developed the potter had many difficulties to overcome. As the design and mechanical operation improved, a better basic product was necessary if the water closet was to be made an absolutely sanitary fixture. Originally water closets were made of a soft, porous body which would craze and absorb liquid. The fixture under these conditions soon became offensive. The demand naturally was for a material which would not absorb—one that would be vitreous, with a hard, smooth surface that would not craze. This presented a big problem to the sanitary potter, for while china having these properties was being made, it was no small accomplishment to make the large sanitary pieces of this material. And it is actually of china that water closets are made today by the better manufacturers.

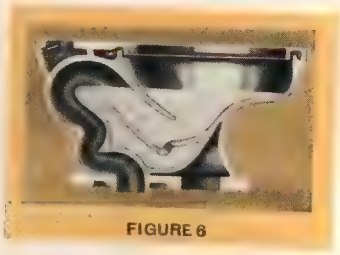

FIGURE 6

FIGURE 7

Recent years have witnessed the many improvements that have made the water closet the sanitary fixture it is today. The non-soiling feature is one which has been given very careful thought by the designers. This has resulted in the extended front bowl and cut back rim at the rear of the bowl, two improvements very necessary to prevent soiling. The thin rim which gives a minimum of unwashed surface inside the bowl practically eliminates the possibility of soiling above the flushing point. (Note figures 6 and 7 which illustrate these features.)

A comparison of the three types of bowls now on the market will best illustrate the superiority of the syphon jet as compared with either the washdown (figures 10 and 11) or reversed trap (figures 8 and 9). Compared with a syphon jet (figures 6 and 7), the washdown and reversed trap have a very small surface of water. This allows much more fouling space inside the bowl.

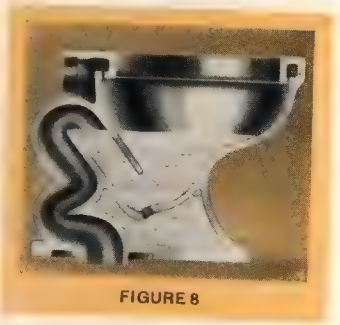

FIGURE 8

FIGURE 9

The washdown, while positive in action, does its work in a very clumsy way. When the tank or valve is operated, the water in the bowl raises and the contents of the bowl is churned around before syphonic action is started. This objection cannot be overcome in the washdown or reversed trap types because of the construction. However, the action is improved by the addition of the jet. These bowls are noisy in operation and do not have as large an opening through the trap.

Figures 6 and 7 illustrate a syphon jet showing the larger water surface and large trap opening. The operation of the syphon jet is very much superior to that of the washdown or reverse trap. Immediately the tank or flush valve is operated, the jet causes the syphonic action to start. The contents of the bowl enter the up leg as the rim wash starts. Consequently, the bowl is emptied quietly and without the churning effect produced in either the washdown or reversed trap.

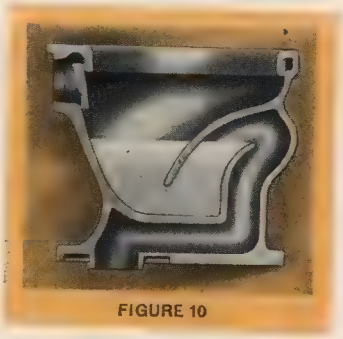

FIGURE 10

The syphon jet is the only style of water closet on which a noiseless feature can be attached. It should be remembered that if a really quiet acting closet is wanted, it must be operated by a low pattern vitreous china tank and not by a flush valve.

FIGURE 11

While the silent feature reduces the noise when the valve is used, the closet will not work as quietly on a valve as it will under a low pattern vitreous china tank.

The most modern water closet of today is the Ariston-Madera Silent, a syphon jet that combines large water surface, extended front and cut back rim bowl, thin non-soiling rim and silent feature.

THOMAS MADDOCK

Vitreous China URINALS

Designed to insure cleanliness, sanitation and service

The Madstone Urinal

UNTIL the perfection of the present pedestal type of urinal, many different kinds were tried but each proved unsatisfactory because it was not sanitary. As a result of this dissatisfaction water closets have been used quite generally instead of urinals. While this practice is entirely sanitary, the water closet is too low for convenient use as a urinal.

The perfected type of syphon jet pedestal urinal is constructed the same as a water closet except that it is higher and designed especially for use as a urinal. The lip in front is low enough for convenient use and the back is high enough to prevent soiling.

As the urinal is installed chiefly in public places, it is subjected to hard usage. Therefore, it must be so designed and constructed as to be strong, service-giving and above all else sanitary. The wall hanging type of urinal, since it has only a small outlet, easily becomes clogged with cigar or cigarette butts and other waste material. In fact this type is unsatisfactory because the wall soon becomes fouled and the fixture cannot be properly cleaned.

One type of urinal in general use today is that known as the stall urinal. One advantage of this urinal is that the floor may be drained into it. But this is a costly installation. The use of a regular floor drain is just as effective and it costs much less.

There are a great many points in favor of the Madstone pedestal urinal over the stall type. The most important one is that the Madstone is made of vitreous china. This material is guaranteed not to craze or crack. Therefore, it cannot absorb urine.

The stall urinal is made of a fire clay body and consequently it is liable to crazing which means cracks developing in the glaze. When this happens the soft, porous body under the glaze absorbs urine, giving off a bad odor. This condition can never be corrected because once urine is absorbed by the body it cannot be eliminated and the toilet room becomes ill-smelling and very unsanitary. The urinal itself also becomes discolored.

There are some stall urinals made of vitreous ware. They are of small size and their cost is almost prohibitive. In these, the disadvantages of the fire clay body have been overcome, but they have all the other objectionable features of the stall urinal.

Because of the small opening in the outlet grid, the stall urinal readily becomes clogged and often overflows onto the floor making a most unsanitary and unhealthy condition.

In stall urinal installations there are necessarily a number of seams where the stalls are fitted together. These seams hold dirt and tend to make the urinal unsanitary. In the Madstone pedestal urinal all this is eliminated because the urinal is one individual unit. Since the stall urinal does not carry a body of water, the undiluted urine remains if it is not flushed each time it is used. Thus a bad odor is given off. The Madstone has a body of water 6½ x 6½ inches. Furthermore, it has a flushing rim which encircles the entire top of the urinal, hence, there is no dry urinating surface on the Madstone because the inside walls are thoroughly washed and cleansed at every flush.

The top plan of the Madstone (shown on page 203) illustrates the exceptionally long extension of the lip on the Pedestal urinal as compared with that of the urinal stall. This extension eliminates the wet unsanitary floor generally found in public toilets where stall urinals are used. It also prevents urine from splashing on the shoes and clothing of the user.

The Madstone pedestal urinal is constructed on the same principle as the modern water closet, inasmuch as it is flushed and cleansed by syphonic action. It is the cleanest and best urinal made because all waste matter is removed at each flush. The opening through the trap is as large as that of most water closets and being of a syphon action type, clogging is practically impossible. This is plainly illustrated in the cross-section shown on page 203.

The Madstone is made in two heights, one for adults and the other for children. The larger one is 24 inches from the floor to the top of the front lip and the juvenile height is 18½ inches. The juvenile height Madstone is ideal for use in schools where children are apt to throw refuse in the urinal. Having a full 2-inch trap opening it will not become stopped up.

There is as much need for a urinal for women as for men. The danger of spreading disease from sitting on unsanitary water closet seats applies equally to both sexes. The juvenile height Madstone is the only urinal made for use by women. Being only 18½ inches from the floor to the top of the front lip, women can use it comfortably without getting any part of the body against the urinal and without disarranging the clothing. The long, narrow, extended lip eliminates the possibility of getting urine on the floor.

Being installed in the same manner as a water closet, the installation cost of the Madstone is kept at a minimum. Considering the necessary piping and other fittings and the cost of installation, the pedestal urinal is less costly than the stall type.

MADESTA K-3201 V

White Vitreous China Syphon Jet Flat Back Urinal with Lip and Flushing Rim; Top Inlet, Wall Outlet with Flush Valve

SPECIFICATION:

Approximate weight, packed complete, pounds	275	295	315	350

Distance Rim to floor, 34 inches.

General Instructions

THE information given here is arranged so as to secure for our customers and those using this catalog the fullest degree of service.

Order by plate number whenever possible. When doing so, mention explicitly if we are to furnish everything as shown. We recommend ordering all fixtures complete.

Every effort is put forth to keep all promises of delivery. Failure to keep them from causes beyond our control does not make us liable.

All goods are shipped at buyer's risk.

We have been especially careful in preparing the weights and measurements on all pieces; however, owing to the variations in the manufacture we cannot guarantee them absolutely.

Any goods proving defective when used for the purpose manufactured will be replaced, but no claim for labor or damages will be allowed.
